

## SEO technology: an overview

SEO technology, a rather new product of the dotcom boom, is a method to boost the traffic to an individual's website. SEO technology is used so a website appears earlier in the search engine results which will lead to an automatic increase in the traffic. This is a rather natural process as there is no affected appearance on the search engine page through advertisement but due to optimization the site ranks higher and appears in the search results.

The SEO technology can be targeted at specific searches such as image search, industry search or also regional searches for city or locality based requirements. Spiders are employed by search engines to rank websites on the basis of information and presentation, thus to appear in the search results a high rank is required to increase inflow of traffic.

An effective use of keywords to increase traffic is one of the essentials of SEO technology. Effective use of keywords could mean the difference of your page being displayed on the first page of a search result or it being so far back in the search results that a visitor would never see it. In the past as SEO technology was a fairly new concept, the cost of optimization was greater as only a few experts dealt with the same, now with self help tutorials and a number of professionals in the field the cost relatively much lesser.

There are various software packs where the important keywords etc. are identified so that you can create a website which ranks higher in the search engine list and the visibility thus increases. Software available today scrutinize search engine hits and analyze what SEO technology a better ranking website would be using. SEO technology does not only target sites related to an industry, even if you have a personal blog which you like to gain popularity, SEO technology can be used for the same.

Primarily as a marketing strategy SEO technology foresees what a consumer searches for and how search engines function, combining the two optimization of any website would increase traffic. There are a number of search engines which work on a commission basis where they demand fees either on the basis of either permanent visibility or cost per click, where the website owner pays for the number of times a visitor visited their website through the Yahoo search engine. An unaccepted and largely immoral SEO technique is called black hat SEO technology where the developer uses techniques such as link farming or keyword stuffing which are considered to be unethical and lead to a lifetime ban to the website from the relevant search engine. Google and other search engines make a point to discourage developers using aggressive marketing skills for more visibility, for this they analyze the off page factors such as page rank and hyperlink analysis.
