

Versatile Industrial Steel Buildings Can Be Used For Just About Any Storage Purpose

With their versatility and strength, industrial steel buildings are suitable for just about any purpose. They provide an affordable yet durable solution whether your needs are for light manufacturing space or storage for farm equipment.

Easy to assemble, industrial steel buildings can be constructed using several different design structures. The P series of buildings offers the greatest possible amount of usable space with its more traditional straight sidewall and arched roof design that places the arch at the top of the sidewalls. With a P series industrial steel building you will have enough room for a backyard workshop or garage, whichever you need. The A series modifies the P series design by offering a 4 to 12 pitch roof for maximum strength and durability in high wind and snow areas. It, too, can be used as backyard workshop or garage. S series buildings have high, straight sidewalls and a curved arch roof that protects from heavy rain and snow accumulation. The high sidewalls give you 100 percent usable vertical and floor space; these industrial steel buildings can be used for small manufacturing, industrial and commercial purposes, as well as for fire and airport fueling stations. You can even fit your recreational vehicle in an S series industrial steel building.

This brings us to the Q series industrial steel building. Also known as Quonset huts, Q series buildings with their rounded corrugated arch design are some of the strongest structures in architecture. Named for the town of Quonset, Rhode Island (the location of the naval base where the hut design was developed), these huts were used extensively during World War II to house troops and equipment in the field. The design was so popular that some returning soldiers purchased the surplus huts to use for their personal housing after the war ended. These days, Q series industrial steel buildings are used for such diverse purposes as airplane hangars and to house grain; their ability to resist tornados, hurricanes, and heavy rain, snow and wind make them ideal storage facilities.

Industrial steel buildings are also popular with farmers. They provide unequalled protection for valuable farm machinery, grain, crops, horses and livestock. Industrial steel buildings are ideal for this purpose. They are much more durable than the traditional wooden pole barn, and also maintenance free. They can also house large quantities of grain, crops and hay.

As you can see, industrial steel buildings are versatile enough to suit just about any purpose. You can even turn one into a guest cottage. See here also [Metal garage buildings](#) - [Metal garage buildings](#) - [Prefabricated metal buildings](#) -
